

Key points that make the difference when purchasing **AXIS Network Cameras**

Considerations related to Security and Safety

Superb image quality

Axis IP-based surveillance cameras offer unrivalled image quality compared to analog cameras. Thanks to modern sensors and lenses, HDTV, and progressive scan, it is much easier to identify people and cover wide areas with fewer cameras.

Easy to design and install

Axis' online tools help you design an IP-based surveillance system, and all new lines of cameras are easy to install. Thanks to Power over Ethernet, we combine power and network connections in a single cable. Moreover, innovations like the pixel counter and the AXIS T8412 installation display help you get everything right.

Flexible, future-proof solutions

IP-based networks are here to stay, and Axis develops intelligent solutions based on open standards. It is easy to add one or more cameras to a system.

Safe solutions

Unlike video sent over a coaxial cable, our network video solutions include encryption and authentication. They include the highest degree of network security such as https, 802.1x and IPv6.

Intelligence at the camera level

Axis' network cameras and video encoders have built-in intelligence that can be configured to only record what you want to know.

Easy, future-proof integration

You can integrate Axis products with computers and Ethernet-based information systems, audio or security systems and other digital devices, in addition to integration with video management and application software.

Free firmware upgrades

Axis continues to develop the software in our products, and we offer these firmware upgrades free to you and your customers. This allow you to add features and functions to your cameras that were not available when you bought them.
